Release notes

7P EMM – Server

Version   6.15
Release date   06.08.2024

Features and adaptations

- Updated Exchange configuration type for iOS and MacOS.
- Removed the Lock screen message section from Autolock configurations and created a new configuration type called "Lock screen message" with same options. New configuration type allows selected options to apply to wider variety of devices.
- Changed input type of Comment fields in operations and configurations to Text Area, allowing line breaks and additional formatting.
- Added Support for limited mass enrolment of DO Android devices with same QR code.
- Application reports now have support for additional 15 fields as well as several new filters.

Fixes

Customer tickets

- Customer ticket 4213:   improved "Export for Excel"
- Customer ticket 4332:   fixed an issue with a new field in Wi-Fi configs

- Customer ticket 4307:   Kiosk App List will now show Android app version only
- Customer Ticket 4362   "Enroll via sms" option now shown when importing a device via csv.

Other issues

- Improved attestation result window - in case of negative result it is now possible to restart attestation directly from attestation result window.
- Updated new GPS switch functionality to respect instance restricted modes and flags
- Removed buttons tied to GPS functionality for Android 8 and older devices, as those are no longer directly supported.
- Added automatic whitespace trim to all text-type configuration fields where it was missing
- Implemented a concept of "update apps only during maintenance window" for very specific use case of application updates.
- Fixed minor issues pointed out in the "Export for excel" report functionality. Resulting file should be easier for excel import automatically - but since that can be subject to local system language/locale explicit "import" function in Excel is still recommended.
- Fixed GPS popups not having their options translated.
- Fixed issue when any device with reported serial number added to pool produced "DEP device added" log entry.
- Improved "Play Integrity" attestation result view to also save/display execution errors

- Allowed global configurations to be selected as default for non-global applications.
- Removed no longer supported (for Android 10 and later devices) action options from UI.
- Fixed issue in header parsing when extra whitespaces are present.
- Fixed issue when local cache was not cleared between new schedule creations.
- Removed duplicate error codes.
- Fixed issue when application icon files could be saved at temporary files and removed by maintenance job.
- Fixed issue where internal paths could be saved as null, resulting in an error. Update script included to update affected paths to default.
- Fixed issue where assigned device report used wrong count function.
